

The Olympic Way building beside Wembley Stadium in London is a mixed-use development of the highest quality, delivering much needed housing and amenity provision to the area.

The tower on this development is the second tallest modular building in London, designed around a central courtyard with a 20-storey residential tower rising from a 7-storey block of housing on the southern boundary. With high levels of noise pollution outside our ST80 window system was required to block out the noise for the first 8-storeys with our ST70 window system installed on the remainder of this tower.

This was a cost-efficient effective solution to the acoustic challenges on this project. As our window systems have identical sight lines, the aesthetic appearance of the building wasn't affected.
